

## Data Engineering and Information Management

### Description

## Leap at the endless possibilities of AI

Artificial Intelligence has taken a paradigm shift in the last decade. Many businesses are resorting to AI to make their products/services more efficient and insightful.

Creating software that is intelligent and capable of doing things that any human can do and even more, AI has become the marrow of digital technology.

## Data Engineering and Information Management

Design and development of AR/VR applications and seamless integration with services such as geolocation, image recognition, speech recognition etc.

### Big Data end to end strategy

We review enterprise information, be it structured or unstructured, from a wide range of sources to provide a thorough and complete view of your business.

### Machine Learning

We are expertized on building end-to-end data science pipeline required for Data Analytics, creating ML models, and for business intelligence.

### AI/Deep Learning

We offer AI/Deep Learning for Test engineering, Natural Language Processing and Image Processing.

## Our Technology Stack

Sample use cases of AI and ML are Time Series analysis, Customer Segmentation, Predictive Analytics, Fraud Detection, Clustering and Segmentation, Classification and Labeling, Dynamic Pricing, Anomaly Detection, Assets Planning.

## Our Team of Experts

Design and development of AR/VR applications and seamless integration with services such as geolocation, image recognition, speech recognition etc.
